

Jared Davis

Vex is a new and big part to me and my life. I have always wanted to be a part of robotics, but had no idea about where to start. I signed up for my robotics club and at first though it seemed a little boring since it was at first all talk. I was a little turned off from robotics even though I loved to build. Then I went to my first real build. I had been able to build my own clawbot in under a day and able to program it; my first VEX robot and I was very proud of it! I saw things in a simple perspective, later I was understood from a new perspective along with the help of the new friends that helped me learn more about VEX and how to build. I was able to join one of the sub-teams, 1138K. I had many ideas for the Sack Attack game and I was poised to tell them. Even though my ideas had flaws, my group leaders explained them to me and helped me learn how to think about an idea and examine it to make it better and flawless. From there, I then helped my team come up with our new and improved idea from all of us. We did well and also turned many heads. I still think that I should do this for the rest of my life since I had a lot of fun.
