

We chose a notebook because our team likes to go freestyle on supporting our lift. It's not that our robot wasn't working it was that we keep modifying our lift so it can do an outstanding job. Our notebook is constantly being updated for our lift. At first we decided to use a 2 bar lift but then we decided it would be best to use a three bar lift. Our robot's lift can end up being completely different as we continue to come up with greater ideas as we go along. We are keeping a basic lift style. We are just changing the way it supports so it can hold more and work better. As we go along we come up with better and better ideas and we test them out to see if they work then we decide which support worked the best and use it but then of course we end up improving it even more. Although we do change our support quite often we still keep the original base of our robot unless we want to make minor changes. As notebook person it's sometimes hard to keep up because of how much we change our support. But as we keep going I assure you our lift will end up working amazingly.
