

This picture reminds me of robotics because robotics can be anything as simply as a lamp. Robotics is many things to me but I just wanted to show that robotics isn't always robots and machines it can be as simply as a lamp. Using a light bulb and using energy to make light is very simply yet very affective. It is a very simply design yet complex at the same time. Also this lamp is made of all recycled materials and left over stuff from the robotics team project. This this super cool because you can use recycled stuff to have fun robotics and not just all new materials. Recycling is a big and effective way to help save our environment!
