

Electronic Online Challenge

By Isaias De Leon

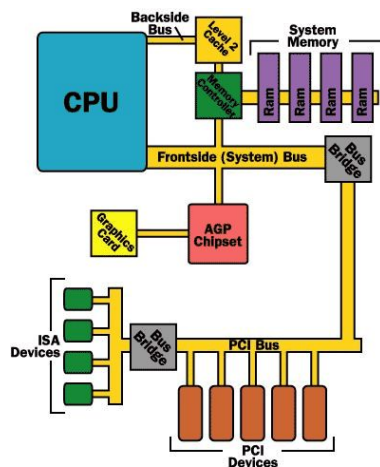

Foreign this Challenge I decided to build a gaming PC. You can build your own PC by buying the parts from the store or you can buy a pre-built computer.

There are many types of Computers for different tasks like playing video games, making renders, video editing, mining, and more.

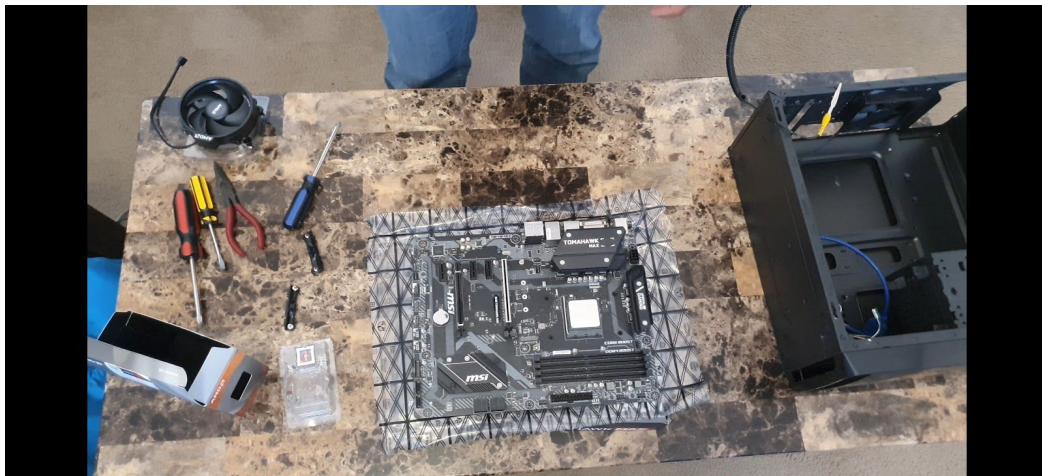

Not every computer is going to have the same components because it depends in the different tasks that it's going to be used.

The parts that you need to build a PC is going to be the CPU, GPU, Ram, Motherboard, storage, power supply, a case, a cooler too cool to CPU .

The specs of the computer that I built his CPU AMD ryzen 3600, GPU GTX 1060 6 gb, Ram Corsair 16GB DDr4 3200mhz, SSD240gb, hard drive1td, motherboard MSC tomahawk b450, case Cooler Master.

To build a PC is not the hard the hard part is to understand what are the function of each think and how to put properly the ride parts of a computer for a specific task.

My PC
