

### My explanation for the game layout

The blue balls are dead cells in our body, which is the field. The robot is a medication that is rapidly trying to replace all the dead cells with live red ones to save the person. A stack of cells creates an organ. To save an organ you have to have a live cell to be the one on top. A row of three saves organs will regain the functionality of that bodily system. There is also a period of time before the medication can be detected and controlled where it has to run autonomously. When the patient wakes up he will pay the hospital 1 dollar for every dead cell removed, 1 dollar for every live cell implanted, 6 dollars for every system cleared, and 6 dollars for every system alive.
