HELP CHANGE THE WORLD

The majority of robots nowadays are utilized to do monotonous tasks or activities that are too risky for humans to perform. A robot is suitable for entering a structure that may contain a bomb. Automobiles, candy bars, and electronics are all made by robots in factories.

Many are now employed in hazardous situations (including inspection of radioactive materials, bomb detection and deactivation.) Robots are expected to take over half of all low-skilled jobs by 2030. They'll become capable of taking on multiple roles in an organization. It's time for us to start thinking about the way we'll interact with our new coworkers - and how we might interact with them.
