Our poster design shows the areas that teams need to be good at in order to be successful in VEX Robotics Programs and a VEX team. Our poster includes images from our team this year that showcases multiple features of being on a robotics team.

The design process of our poster was similar to the design process of our robot. We went through many steps and visited the design process again after we had a decent poster. We first looked at the rules, technical details, and scoring so that we knew the criteria for our poster. We then had everyone make a design based on the rules and scoring so that the poster would fit in the challenge. This allowed everyone to be able to contribute to the project. When everyone finished designing their poster, we scored them ourselves to see the total points each design earned- just like a decision matrix. Some criteria we used were "features of being involved in VEX" and "inspires students". We put all the designs into a form so that everyone could vote on the design they liked the best. One poster design was chosen and we worked together to make it better. We changed many things on the poster during our meetings so that it would be a good design. The poster we have submitted is a collaboration of everyone's work.
