FARM>TECH VILLAGE

In the 20th century, in a distant place, lived a concerned scientist, since, in that place, the settlers dedicated themselves to agriculture, which could not progress because the machines they used were not very efficient.

They had heard of a very clever young scientist who created gadgets to help improve people's work, and they would decided to call her, to help the village scientist.

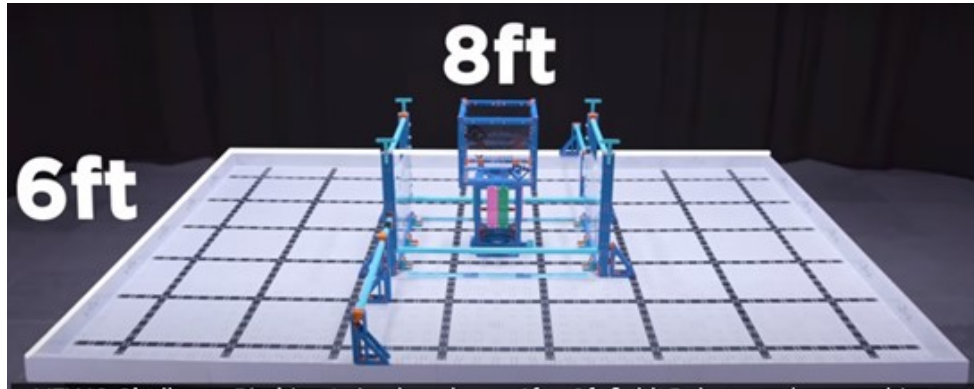

The young scientist, thought about it for a time, made the decision to gladly help the settlers of that place.

The young woman had to take: 2 planes, 1 train and a long walk to reach that remote place.

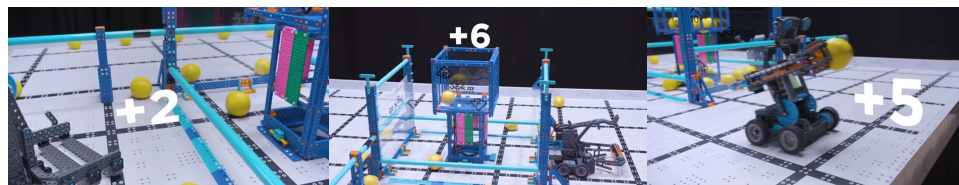

The next day the village scientist was very upset because the villagers have not told him that the young woman would come to help with the machines, since he always worked alone and did not know how to work in a team. Then he felt so slighted that he challenged her to a tournament .The young woman accept.

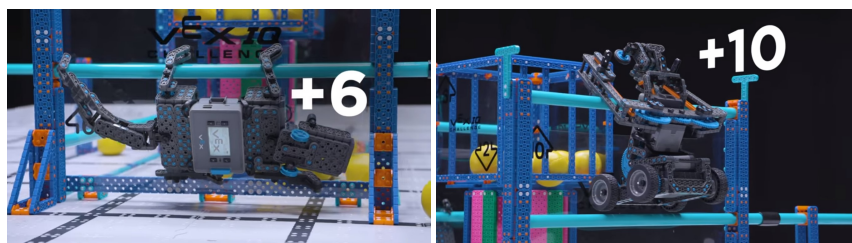

The challenge was, each one had to create a machine, which could harvest as much food as possible in a 6 by 8 feet field in a minute.

There were two ways to score points, the high of 6 points and the low of 2 points. There was also an extra score of 5 lemons at the end of the field.

And to conclude there were two ways to park the machinery, the first floor of 6 points and the second floor of 10 points.

The two scientists went to work hard as the time they had for the challenge was only three weeks.

The weeks passed and the long-awaited day arrived:

Young- Before starting I wish you good luck and I hope you understand that the most important thing is not to be the best, but to help the villagers and learn to work as a team.

The 2 scientists gave their best, and unbelievably achieved a very good harvest. And so we began to work together and they managed to help the people by improving the machinery.

Another happy ending...
