

# CREATE AND INSPIRE

Samantha Tan #62880B :: NY

---

As a student invested into robotics, I find myself believing that robotics is a crucial aspect of everyone's life. Without it we wouldn't have the technology today, and young students must understand that. By participating in vex, I've been able to deeply understand how many mechanical functions work and how to program them.

To make the poster design, I myself used the engineering design process. First, I asked myself how I would lay everything out to make a appealing and attractive design. Next, I looked at other recruitment posters for just a little bit of inspiration. After, I created my design while imagining what it'd look like along the way. Lastly, I found my final product and continued to improve it over time.

This poster briefly explains what VEX robotics could bring you. It brings up the engineering design process and various programs we'd work with in order to have a functional robot. We must create and inspire in order to advance in society.
