

Make it real challenge
L shaped channel

The component that I made helps improve structure for channels. Instead of using a lot of screws to make sure a channel is stable. The new part is used by placing it on the chassis and attaching it to a channel. The L channel isn't big enough so it doesn't bother anything. It is small and has a strong structure. The L shaped channel helps pull the chassis and channel together helping them from not falling. The part is very sustainable to bring parts together and hold them. Rather than using many parts to make a strong structure you can just use this part and use a few screws. You can use it in different ways to make a good structure.

This picture is the L shaped channel to support structures.
