# Why schools should have a robotics team

Schools should have a robotics team because it teaches kids about failure, teaches them how to code, and it makes them work together.

First I will be telling you how robotics teaches kids how to code. Kids code the robots to do multiple things for example to fling a ball into a basket. This is important because in the future coding will be in multiple jobs.

My second reason is that robotics teaches kids about failure, for example if the robot doesn't work they have to find out how to fix it. This is useful because it teaches kids that is ok to fail.

My last reason is that robotics makes them work together. Kids will be put into teams with random people (most of the time they do not know each other) they have to work with each other even if they don't like them. This teaches them how to deal with people they don't like.

I hope your school will make a robotics team after hearing my reasons.
