

Global Online Challenge: Poster Design

Team Name/Number:

RockBots, 2929A

Team Members:

Alexis Garcia

Gabriel Guillermo

Christian Cancio

Team Location:

South Florida

Design process:

First, we brainstormed different themes that our poster will have to have more of a clear understanding on the layout. Our first idea was space, we did not choose this one because we thought that the idea of space was too far from the message that we were trying to give. Our second idea was electricity. We wanted to add in electric bolts around the poster to give it the engineering feeling however we thought that it was slightly too uncreative. Our third and final idea was to make the poster, like a robot and we would add in what we wanted to say on different parts of the robot. We decided we were going to choose this one as our final design. We then started to brainstorm different ideas on what would inspire others to join vex robotics. Once we came up with all that we wanted to say, we decided to add them into our design together with our chosen theme of robots.

Poster description:

The main idea for our poster is to catch the eyes of people who are interested in engineering and showing them what kinds of opportunities there are. Many people don't take the first step into engineering and this poster just might show them one.

Engineering now is a very important part of our lives now because of all the new innovations and vex IQ can help in finding those people with that interest in helping build the future.
