ROBOTICS

Our lives are a constant series of challenges, some with a qualitative result, others quantitative ones. In competitive robotics, one's quantitative scores can lead to a dream-come-true. In VEX Robotics, teams have to think of the most efficient path to collect points and score points to ultimately win the match. During competitions, teams need to be able to identify the patterns of other teams to develop the best strategy. This is all the result of hard work and determination - being able to analyze and evaluate scores and metrics, and draw conclusions that can help us in the game called life.
