

# Why Would You Learn Robotics?

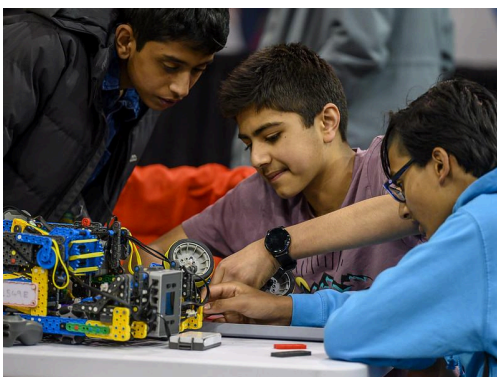

**Robotics encourages kids to think creatively,  
to build and design solutions to problems and come up with original ideas.**

When you learn robotics your mind gets more active, when your brain gets active you will learn more and get smarter. When you join robotics you get better at learning stuff by yourself, because in robotics you build, drive and code yourself but your teacher can help you. When you go to robotics most of the time you go to a team because there is always a team near you.

Every year there is a new challenge, so you won't be bored.

At robotics you prepare for a competition. If you win you might go to Worlds. Worlds is a competition with people from all around the world, But before going to Worlds you have to qualify at provincials, which is people in your province or your state. To go to provincials you need to win an award but not any award you need to win excellence, design or teamwork championship. To get an award it is up to the judges to choose except for teamwork champion which is based on points.

If you are thinking, "Why go to a competition? Can't you just build a robot and play with it?" Well at competition you meet more robotics people and discover more ideas and improve your own robot.
